

## A String Of Equations Is A String Of Statements

In math books you frequently see “strings” of equations, as in this excerpt:

$$(x - 2)(x + 3) = x^2 - 2x + 3x - 6 = x^2 + x - 6.$$

Translated into plain text or read aloud, this is

The quantity  $x$  minus 2, times the quantity  $x$  plus 3, equals  $x$  squared, minus 2 times  $x$ , plus 3 times  $x$ , minus 6, which equals  $x$  squared plus  $x$  minus 6.

Notice that the second “=” is pronounced “which equals”, so that the sentence sounds grammatical. When a sentence is written with two “=”s like this, it is really making two statements: It says that the first quantity equals the second, and that the second equals the third. The two statements could be written separately, as in

$$(x - 2)(x + 3) = x^2 - 2x + 3x - 6. \quad x^2 - 2x + 3x - 6 = x^2 + x - 6.$$

However, that is poor writing. The “ $x^2 - 2x + 3x - 6$ ” appears twice, wasting time and space and obscuring the logical connection between the two equations.

In long calculations there may be many equations strung together, as in this snippet:

$$\begin{aligned} \frac{e^b - e^a}{b - a} (ta + (1 - t)b - a) &= \frac{e^b - e^a}{b - a} ((1 - t)b + (t - 1)a) = \\ \frac{e^b - e^a}{b - a} ((1 - t)b - (1 - t)a) &= \frac{e^b - e^a}{b - a} (1 - t)(b - a) = (e^b - e^a)(1 - t). \end{aligned}$$

Every “=” after the first one is pronounced “which equals”, to create one enormous sentence with several clauses. While technically correct, it’s difficult to read, compared to this:

$$\begin{aligned} \frac{e^b - e^a}{b - a} (ta + (1 - t)b - a) &= \frac{e^b - e^a}{b - a} ((1 - t)b + (t - 1)a) \\ &= \frac{e^b - e^a}{b - a} ((1 - t)b - (1 - t)a) \\ &= \frac{e^b - e^a}{b - a} (1 - t)(b - a) \\ &= (e^b - e^a)(1 - t). \end{aligned}$$

These two snippets use exactly the same text, and you read/pronounce them identically. The only difference is formatting. I’ve *stacked* the “=”s, meaning that I’ve put one “=” on each line and I’ve also vertically aligned all of the “=”s. This uses a lot of space, but it greatly helps the reader recognize and compare the steps, so that she can focus on the math itself.

Notice that there is still just one period, at the end of the whole sentence. Just as in an English paper, you put a period at the end of every *sentence*, not at the end of every *line*.

Here is an excerpt from a student’s homework; by the way, he’s solving  $x^2 + 5x + 6 = 0$ .

$$\begin{aligned}
 x &= \frac{-5 \pm \sqrt{5^2 - 4 \cdot 1 \cdot 6}}{2} \\
 x &= \frac{-5 \pm \sqrt{25 - 24}}{2} \\
 x &= \frac{-5 \pm 1}{2}
 \end{aligned}$$

It's not a disaster (you can understand what he's trying to say), but it's not well-written either. We can fix it up by simply deleting some "x"s and adding a period:

$$\begin{aligned}
 x &= \frac{-5 \pm \sqrt{5^2 - 4 \cdot 1 \cdot 6}}{2} \\
 &= \frac{-5 \pm \sqrt{25 - 24}}{2} \\
 &= \frac{-5 \pm 1}{2}.
 \end{aligned}$$

When writing up your math homework, save yourself writing (and your reader reading) by stringing together equations when you can. For equations longer than one line, stack the "="s so that there is one per line and they're all aligned. The same goes for "<", "≤", ">", and "≥" in inequalities; stack them up with each other and with any "="s in the sentence.

When you are writing under time pressure (such as on exams or at the chalkboard), it is understandable if your formatting isn't perfect — but still be sure to write sensible sentences.

## Exercises

- A. Translate into plain text, keeping no symbols except numeric ones ("1.5", "π", etc.).

$$\cos\left(\frac{1.5\pi + 0.5\pi}{4}\right) = \cos(\pi/2) = 0.$$

- B. This string of equations is too wide for my paper; help me by writing it in stacked form.

$$\frac{6x^4 - 2 - 5x^4 + 1}{x - 1} = \frac{x^4 - 1}{x - 1} = \frac{(x - 1)(x^3 + x^2 + x + 1)}{x - 1} = x^3 + x^2 + x + 1.$$

- C. Fix up this student's homework, so that it's a well-formatted, grammatical sentence.

$$\begin{aligned}
 m &= \frac{(x + h)^3 - x^3}{h} = \frac{x^3 + 3x^2h + 3xh^2 + h^3 - x^3}{h} \\
 &= \frac{3x^2h + 3xh^2 + h^3}{h} \\
 m &= 3x^2 + 3xh + h^2
 \end{aligned}$$
